1. Web Data:

The GDP dataset was collected from the Worldometer website. This data provides country-level economic indicators which were used to enrich the analysis and compare sales performance across different regions.

2. Excel Data(January, February, and March):

Monthly sales data for January, February, and March was created manually in Excel using random formulas to simulate real-world business transactions. The dataset includes fields such as Order ID, Order Date, Employee ID, Region, Product, Revenue, and Cost.

All three monthly files were stored in a single folder and combined in Power BI using the Folder connector (Combine & Transform), effectively appending the data into a unified sales dataset.

3. Employee Data:

The employee dataset contains information such as Employee ID, Name, Department, Region, Join Date, and Birthdate. This data was used to enrich the sales data by merging on Employee ID, enabling employee-level analysis.

Web Data Transformation Summary (GDP Data)

The following steps were performed:

- Selected the relevant HTML table from the Navigator
- Promoted the first row as headers
- Removed unnecessary rows and columns
- Cleaned country names by removing extra annotations
- Removed commas from numeric values and converted them into proper numeric data types
- Renamed columns to simple and meaningful names (e.g., IMF_GDP, WB_GDP, UN_GDP)
- Removed unwanted rows such as aggregated totals (e.g., “World”)
- Handled null values to ensure data quality

The cleaned dataset was then loaded into the Power BI model for further analysis.

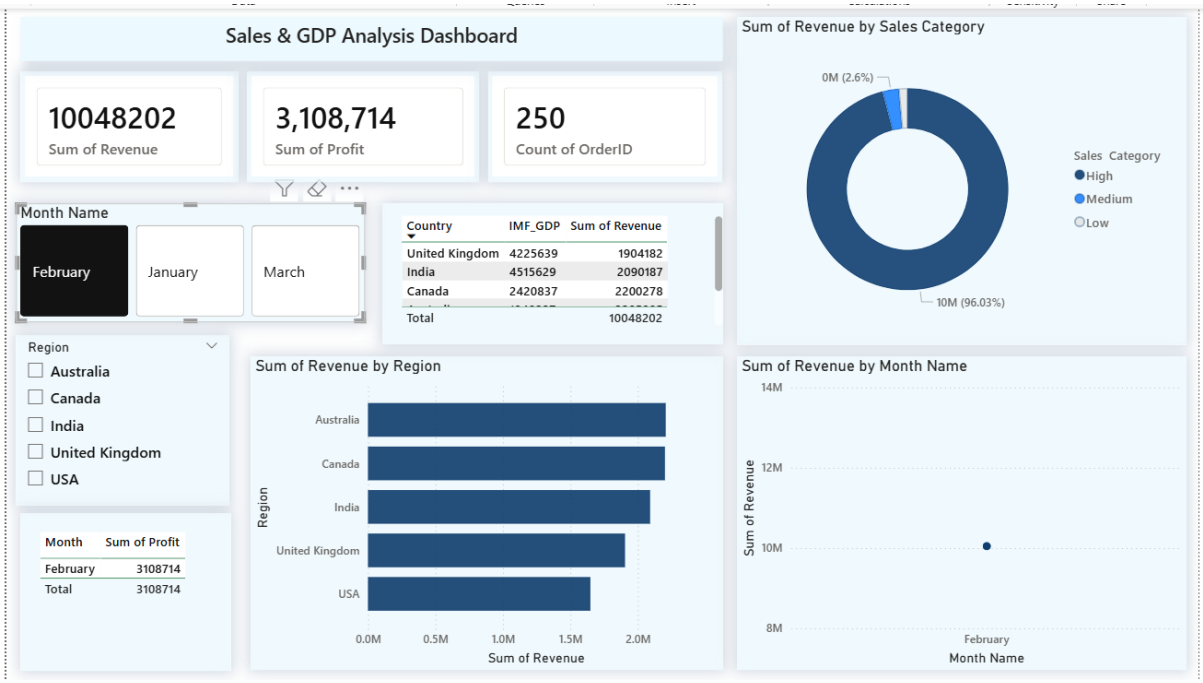
FEBRUARY FILTER



Insights:

1. **The total revenue generated is approximately 21.9M, indicating strong overall sales performance across regions.**
2. **The majority of revenue comes from the High sales category, contributing around 95% of total sales, showing that high-value transactions dominate the business.**
3. **Among all regions, India, USA, and the United Kingdom are the top-performing regions in terms of total revenue.**
4. **Monthly analysis shows that February recorded the highest profit compared to January and March, indicating a peak sales period.**
5. **There is a noticeable relationship between GDP and sales, where countries with higher GDP tend to generate higher sales, suggesting economic strength influences business performance.**
